Email : zhewang8@illinois.edu

Mobile : +1-217-200-3185

SKILLS

- **Languages:** Matlab, C++, Java, Python, Javascript, Objective-C, Swift **Database:** MySQL, SQLite, MongoDB **Backend:** Spring Boot, MyBatis, Google Cloud Platform(SQL/Compute Engine), CGI, Axios, web-scraping, RESTful API, Linux, Nginx, Protocol Buffers **Frontend:** React, CSS, Ant-Design **Client:** Cocoa, Android, RxSwift **DevOps:** Jenkins, BlueKing CI **Others:** Git, Postman, WebSocket, CDN, TAPD, Design patterns

WORK EXPERIENCE

- **Tencent Holdings (OTC: TCEHY)** Shenzhen, China
WeChat For Mac - Cocoa, C++, Unix, Swift, SQLite, CGI, Protobuf, BlueKing CI *Jul. 2020 - Aug. 2021*
 - **Cocoa:** Built 10+ new features for WeChat for Mac (<https://mac.weixin.qq.com/?lang=en>) based on Apple Cocoa. Ranked Top 1 in Chinese Mac Apple Store Top Charts, and has 5 million users.
 - **File System:** Developed a file storage service for WeChat. Replaced file copy with hard links in Unix to reduce space occupancy and managed through inodes.
 - **Storage Service:** Implemented a scalable database structure and local data service of WeChat Social Networking Services using Swift with facade design pattern and RxSwift to handle asynchronous requests and data flow.
 - **Database Optimization:** Analyzed Full-Text Search module source code in SQLite and refactored service code. Brought about **20x speed boost** and **10% reduction of database space usage**.
 - **Service Optimization:** Improved messages synchronization of WeChat by increasing packet size and batching SQLite database writes with multi-threading, enabling the service to handle the latest 24 hours of historical messages, rather than 2 hours.
 - **Network Optimization:** Optimized file download and upload logic and support for large file transfer with Mars framework (<https://github.com/Tencent/mars>), a cross-platform network library. Utilized CGI to interact with the backend and Protocol Buffers to serialize data.
 - **DevOps:** Deployed software on the CDN servers leveraging BlueKing CI (<https://github.com/Tencent/bk-ci>).
WeChat For Car - Java, Android, ADB *Jul. 2019 - Sep. 2019*
 - **Android:** Implemented WeChat for Car using Android. It was shown at **the Smart China Expo** in 2019, and Vice Premier of the Chinese State Council He Liu experienced and gave highly complimentary remarks.
 - **Components:** Accomplished a simpler way to save status information of views to help add a new float window page to the UI in Android, so developers need not save state information themselves and implement functions of going back and forward.
 - **Performance Optimization:** Detected main reason for low startup speed by monitoring stack information of Android system through ADB, **increasing startup speed by 50%**.

PROJECTS

- **SoccerGod** *Oct. 2021 - Dec. 2021*
Full-stack website users can browse news, view teams and players, post topics and comments, and predict results to earn points.
 - **Backend:** Built several **RESTful APIs** with **Spring Boot**. Stored data and models into **MySQL** and **MongoDB**.
 - **Frontend:** Created a **React.js** frontend, and integrated with backend through **Axios**. Ant-Design and CSS were used for the UI design.
 - **Web-scraping:** Leveraged web crawler to collect information from FIFA and other websites, achieved data visualization, and trained Machine Learning models with **Python** to predict competition results.
 - **Cloud:** Deployed to **Google Cloud Platform**. Used **Nginx** for load balancing to adapt to high concurrency.
 - **DevOps:** Managed and packaged services using **Maven**. Automated build and continuous integration with **Jenkin**.

EDUCATION

- **University of Illinois at Urbana-Champaign:** M.Eng., ECE, Software Track Champaign, IL Dec. 2022
- **Sichuan University:** B.S., Software Engineering Chengdu, China, Dec. 2020
- **National University of Singapore:** Summer Workshop, Computer Science Singapore, Aug. 2018
